Professional Biography

Jamie Butler builds the technology foundation that lets companies grow without growing their complexity. For more than twenty years he has worked the same problem across legal services, healthcare staffing, financial services, manufacturing, and retail: systems that don't talk to each other, processes that run on effort instead of architecture, and leadership that can't see the business clearly. He fixes the foundation, and the business changes with it.

He currently serves as Vice President of End-User Computing at Applied Systems, a global provider of cloud software for the insurance industry, where he owns the enterprise collaboration, service management, and communications platforms, with EUC positioned as the organization's primary driver of AI adoption.

Before Applied, as Senior Director of Technology at Latitude Legal, he ran enterprise technology through rapid growth and four post-acquisition integrations. He re-architected a Microsoft 365 environment as the company grew from 150 to 500 users, moved the business onto one Salesforce platform, automated the contract lifecycle in Ironclad, and stood up a security program from the ground up. Each initiative changed how the business performed.

Before that he was Vice President of Technology at AlliedUP Cooperative, where he consolidated recruiting and CRM onto one Bullhorn platform, implemented ADP Workforce Now, owned a budget above one million dollars, and built the reporting that gave the board and grant stakeholders real-time visibility. At EOSG Resources he sustained an enterprise stack through eight years of growth, including two ERP migrations and an integrated pipeline connecting recruiting, payroll, and finance for roughly 900 active clients.

The earlier years built the depth: ERP implementations in manufacturing, a retail inventory system, and network and database administration. That hands-on foundation never left. It is why he can set strategy in a leadership conversation and then go into the architecture to make sure it gets built right. Architecture, not administration.

He leads distributed teams across in-house, nearshore, and offshore environments, and holds an MBA in Business Information Systems, computer science degrees focused on information security and network systems, and PMP training, with additional credentials in AI and cloud architecture. His operating principle hasn't changed in twenty years: the foundation is the transformation.
